Introduction

C# is one of the most popular languages for making games today.

It started as a tool for business apps, but quickly became the main language for Unity — the world's most used game engine.

How C# Became a Game Language

Microsoft created C# in 2000 for Windows apps.

For a few years, nobody used it for games. Then in 2005, Unity came out and chose C# as its main scripting language.

That changed everything. Unity made game development easy, and C# made it understandable.

Why C# Is So Good

C# is easy to read and write. It has clean syntax and automatic memory management. It is a great balance: not too hard like C++, not too slow like Python. It just works.

C# Becomes Faster

People used to say C# was too slow for big games with thousands of enemies. Unity fixed this with DOTS. DOTS allows C# to use all CPU cores at once, which makes it much faster.

It also has a Burst Compiler that turns C# code into super-fast machine code.

Conclusion

C# is not just a language. It is a gateway to game development. If you dream of making games, C# is your best first step.
